LINEARLIZATION OF GENERALIZED FIBONACCI SEQUENCES

YOUNG HO JANG AND SANG PYO JUN†

Abstract. In this paper, we give linearization of generalized Fibonacci sequences \{g_n\} and \{q_n\}, respectively, defined by Eq.(5) and Eq.(6) below and use this result to give the matrix form of the nth power of a companion matrix of \{g_n\} and \{q_n\}, respectively. Then we re-prove the Cassini’s identity for \{g_n\} and \{q_n\}, respectively.

1. Introduction

Let \( Q = \begin{pmatrix} 1 & 1 \\ 1 & 0 \end{pmatrix} \) be a companion matrix of the Fibonacci sequence \{f_n\} defined by the second-order linear recurrence relation

\[ f_0 = 0, \quad f_1 = 1, \quad f_n = f_{n-1} + f_{n-2} \quad (n \geq 2). \]

Then, by an inductive argument ([10], [7], [8]), the nth power \( Q^n \) has the matrix form

\[ Q^n = \begin{pmatrix} f_{n+1} & f_n \\ f_n & f_{n-1} \end{pmatrix} \quad (n \geq 1). \]

This property provides an alternate proof of the Cassini’s identity for \{f_n\}

\[f_{n-1}f_{n+1} - f_n^2 = (-1)^n \quad (n \geq 1).\]

Now, let’s think of the other access method in order to give the matrix form Eq.(1) of \(Q^n\). This method gives the motivation of our research. That is, our research is based on the following observation: It is well known [5] that the usual Fibonacci numbers can be expressed using Binet’s formula

\[
f_n = \frac{1}{\sqrt{5}} \left[ \left(\frac{1 + \sqrt{5}}{2}\right)^n - \left(\frac{1 - \sqrt{5}}{2}\right)^n \right] = \frac{\alpha^n - \beta^n}{\alpha - \beta},
\]

where \(\alpha, \beta\) are the roots of the quadratic equation \(x^2 - x - 1 = 0\) and \(\alpha > \beta\). From the Binet’s formula Eq.(2), we have for any integer \(n \geq 1\)

\[
f_n - \beta f_{n-1} = \frac{\alpha^n - \beta^n}{\alpha - \beta} - \frac{\beta(\alpha^{n-1} - \beta^{n-1})}{\alpha - \beta} = \frac{\alpha^{n-1}(\alpha - \beta)}{\alpha - \beta} = \alpha^{n-1}.
\]

Multiplying Eq.(3) by \(\alpha\), using \(\alpha\beta = -1\), and if we change \(\alpha\) and \(\beta\) role above process, we obtain the linearization of \(\{f_n\}\)

\[
\text{Linearization of } \{f_n\} : \begin{cases} 
\alpha^n = f_n \alpha + f_{n-1}, \\
\beta^n = f_n \beta + f_{n-1}.
\end{cases}
\]

In Eq.(4), if we change \(\alpha, \beta\) into the companion matrix \(Q\) and change \(f_{n-1}\) into the matrix \(f_{n-1}I\), where \(I\) is the 2 \times 2 identity matrix, then we obtain the matrix form Eq.(1) of \(Q^n\)

\[
Q^n = f_n Q + f_{n-1} I \quad \left(= \begin{pmatrix} f_{n+1} & f_n \\ f_n & f_{n-1} \end{pmatrix}\right).
\]

The Fibonacci sequence has been generalized in many ways, for example, by changing the recurrence relation while preserving the initial terms, by altering the initial terms but maintaining the recurrence relation, by combining of these two techniques, and so on (for more details see [2, 3, 4, 7, 11]).

In this paper, we consider two types of generalized Fibonacci sequences which are basically different. One is the sequence \{\(g_n\)\} defined by Gupta et al. [4] depending on four positive integer parameters \(g_0, g_1, a\) and \(b\) used in the second-order linear recurrence relation:

\[
g_n = ag_{n-1} + bg_{n-2} \quad (n \geq 2)
\]
Another is the sequence \( \{q_n\} \) defined by Edson et al. [2] depending on two positive integer parameters \( a \) and \( b \) used in the second-order non-linear recurrence relation:

\[
q_0 = 0, \quad q_1 = 1, \quad q_n = \begin{cases} \alpha q_{n-1} + \alpha q_{n-2}, & \text{if } n \text{ is even} \\ \beta q_{n-1} + \beta q_{n-2}, & \text{if } n \text{ is odd} \end{cases} (n \geq 2)
\]

In this paper, as mentioned above, we provide linearization of \( \{g_n\} \) and \( \{q_n\} \), respectively, and use this result to give the matrix form of the \( n \)-th power of a companion matrix of \( \{g_n\} \) and \( \{q_n\} \), respectively. Then we re-prove the Cassini’s identity for \( \{g_n\} \) and \( \{q_n\} \), respectively.

2. Linearization of the generalized Fibonacci sequences \( \{g_n\} \)

Many number theory texts (see for example, Niven and Zuckermann [9]) prove that the analogous Binet’s formula for the generalized Fibonacci sequence \( \{g_n\} \) defined by Eq.(5) is

\[
(\alpha - \beta)g_n = g_1(\alpha^n - \beta^n) + g_0(\alpha \beta^n - \beta \alpha^n),
\]

where \( \alpha, \beta \) are the roots of the quadratic equation \( x^2 - ax - b = 0 \) provided \( a^2 + 4b \neq 0 \).

In [12], using an inductive argument, authors give the matrix form of the \( n \)-th power of a companion matrix \( M = \begin{pmatrix} a & b \\ 1 & 0 \end{pmatrix} \) of \( \{g_n\} \)

\[
M^n \begin{pmatrix} g_2 & g_1 \\ g_1 & g_0 \end{pmatrix} = \begin{pmatrix} g_{n+2} & g_{n+1} \\ g_{n+1} & g_n \end{pmatrix}.
\]

And then give the Cassini’s identity for \( \{g_n\} \) by taking determinant both sides of the matrix form Eq.(8)

\[
g_ng_{n+2} - g_{n+1}^2 = (-b)^n(g_0g_2 - g_1^2).
\]

In this subsection, we give the linearization of \( \{g_n\} \) and then use this result to obtain the matrix form Eq.(8).

**Theorem 2.1.** Let \( \{g_n\} \), \( \alpha \) and \( \beta \) be as above. Then we have for all integer \( n \geq 1 \)

\[
\text{Linearization of } \{g_n\} : \begin{cases} \alpha^n(g_1\alpha + bg_0) = g_{n+1}\alpha + bg_n, \\ \beta^n(g_1\beta + bg_0) = g_{n+1}\beta + bg_n. \end{cases}
\]
Proof. Using the Binet’s formula Eq.(7), we have

\[
(\alpha - \beta)g_{n+1} - \beta(\alpha - \beta)g_n = g_1(\alpha^{n+1} - \beta^{n+1}) + g_0(\alpha\beta^{n+1} - \beta\alpha^{n+1}) - g_1\beta(\alpha^n - \beta^n) - g_0(\alpha\beta^n - \beta^2\alpha^n)
\]

Since \(\alpha \neq \beta\), we get

\[
g_{n+1} - \beta g_n = g_1\alpha^n - g_0\beta\alpha^n.
\]

Multiplying Eq.(11) by \(\alpha\) and using \(\alpha\beta = -b\), we have

\[
\alpha g_{n+1} + bg_n = g_1\alpha^{n+1} + bg_0\alpha^n = \alpha^n(g_1\alpha + bg_0).
\]

If we change \(\alpha\) and \(\beta\) role above process, we obtain the desired result Eq.(10).

We can re-prove equations Eq.(8) and Eq.(9) by using the linearlization Eq.(10) of \(\{g_n\}\).

**Corollary 2.2.** Let \(M = \begin{pmatrix} a & b \\ 1 & 0 \end{pmatrix}\) be a companion matrix of \(\{g_n\}\). Then the matrix form of the nth power \(M^n\) is given by Eq.(8) and the Cassini’s identity for \(\{g_n\}\) is given by Eq.(9).

**Proof.** In Eq.(10), if we change \(\alpha, \beta\) into the matrix \(M\) and change \(bg_n\) into the matrix \(bg_nI\), then we have

\[
M^n(g_1M + bg_0I) = g_{n+1}M + bg_nI.
\]

In fact, Eq.(12) holds for the following reason: Since

\[
M \begin{pmatrix} g_n \\ g_{n-1} \end{pmatrix} = \begin{pmatrix} g_{n+1} \\ g_n \end{pmatrix} \text{ and } M^n \begin{pmatrix} g_1 \\ g_0 \end{pmatrix} = \begin{pmatrix} g_{n+1} \\ g_n \end{pmatrix},
\]
we have
\[
M^n(g_1 M + b g_0 I) \begin{pmatrix} g_1 \\ g_0 \end{pmatrix}
\]
\[
= g_1 M^{n+1} \begin{pmatrix} g_1 \\ g_0 \end{pmatrix} + b g_0 M^n \begin{pmatrix} g_1 \\ g_0 \end{pmatrix}
= g_1 \begin{pmatrix} g_{n+2} \\ g_{n+1} \end{pmatrix} + b g_0 \begin{pmatrix} g_{n+1} \\ g_n \end{pmatrix}
\]
\[
= g_1 \begin{pmatrix} a g_{n+1} + b g_n \\ g_{n+1} \\ g_n \end{pmatrix} + b g_0 \begin{pmatrix} g_{n+1} \\ g_n \end{pmatrix}
= g_1 g_n + (a g_1 + b g_0) g_{n+1} + b g_0 g_n + g_1 g_{n+1}
\]
\[
= g_n M \begin{pmatrix} g_1 \\ g_0 \end{pmatrix} + b g_n \begin{pmatrix} g_1 \\ g_0 \end{pmatrix}
= (g_{n+1} M + b g_n I) \begin{pmatrix} g_1 \\ g_0 \end{pmatrix}
\]

Thus from Eq.(12) we have
\[
M^n(g_1 M + b g_0 I) = M^n \begin{pmatrix} a g_1 + b g_0 \\ g_1 \\ b g_0 \end{pmatrix} = M^n \begin{pmatrix} g_2 \\ g_1 \\ b g_0 \end{pmatrix}
= M^n \begin{pmatrix} g_2 \\ g_1 \\ g_0 \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & b \end{pmatrix}
\]
\[
g_{n+1} M + b g_n I = \begin{pmatrix} a g_{n+1} + b g_n \\ g_{n+1} \\ b g_n \end{pmatrix} = \begin{pmatrix} g_{n+2} \\ g_{n+1} \\ b g_n \end{pmatrix}
= \begin{pmatrix} g_{n+2} \\ g_{n+1} \\ g_n \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & b \end{pmatrix}
\]

Since the matrix \( \begin{pmatrix} 1 & 0 \\ 0 & b \end{pmatrix} \) is invertible, we obtain the desired result Eq.(8) and by taking determinant both sides of the matrix form Eq.(8) we obtain the desired result Eq.(9).

3. Linearization of the generalized Fibonacci sequences \( \{q_n\} \)

Edson et al. [2] give the generating function for the generalized Fibonacci sequence \( \{q_n\} \) defined by Eq.(6)
\[
F(x) = \frac{x(1 + ax - x^2)}{1 - (ab + 2)x^2 + x^4}
\]
and then give the extended Binet’s formula by using the generating function \( F(x) \)

\[
q_n = \left( \frac{a^{1-\xi(n)}}{(ab)^{\frac{n-\xi(n)}{2}}} \right) \frac{\alpha^n - \beta^n}{\alpha - \beta},
\]

where \( \alpha, \beta \) are the roots of the quadratic equation \( x^2 - abx - ab = 0 \) provided \( a^2b^2 + 4ab \neq 0 \) and

\[
\xi(n) = \begin{cases} 
0 & \text{if } n \text{ is even,} \\
1 & \text{if } n \text{ is odd.}
\end{cases}
\]

is the parity function. Also, using the extended Binet’s formula Eq.(13), give the Cassini’s identity:

\[
a^{1-\xi(n)}b^{\xi(n)}q_{n-1}q_{n+1} - a^{\xi(n)}b^{1-\xi(n)}q_n^2 = a(-1)^n.
\]

In this subsection, we give the linealization of \( \{q_n\} \) and then use this result to obtain the matrix form of the \( n \)th power of a companion matrix of \( \{q_n\} \).

**Theorem 3.1.** Let \( \{q_n\} \), \( \alpha \), \( \beta \) and \( \xi(n) \) be as above. Then we have for all integer \( n \geq 1 \)

\[
\alpha^n = a^{-1}a^{\frac{n+\xi(n)}{2}}b^{\frac{n-\xi(n)}{2}}q_n\alpha + a^{\frac{n-\xi(n)}{2}}b^{\frac{n+\xi(n)}{2}}q_{n-1},
\]

\[
\beta^n = a^{-1}a^{\frac{n-\xi(n)}{2}}b^{\frac{n-\xi(n)}{2}}q_n\beta + a^{\frac{n-\xi(n)}{2}}b^{\frac{n+\xi(n)}{2}}q_{n-1}.
\]

**Proof.** Since Eq.(16) holds for \( n = 1 \), let \( n \geq 2 \). Using the extended Binet’s formula Eq.(13), we have

\[
q_n - \frac{\beta^2}{ab}q_{n-2} = \left( \frac{a^{1-\xi(n)}}{(ab)^{\frac{n-\xi(n)}{2}}} \right) \frac{\alpha^n - \beta^n}{\alpha - \beta} - \frac{\beta^2}{ab} \left( \frac{a^{1-\xi(n-2)}}{(ab)^{\frac{n-2-\xi(n-2)}{2}}} \right) \frac{\alpha^{n-2} - \beta^{n-2}}{\alpha - \beta}
\]

\[
= \frac{\alpha^{n-2}}{\alpha - \beta} \left( \frac{a^{1-\xi(n)}}{(ab)^{\frac{n-\xi(n)}{2}}} \right) \frac{\alpha^n - \beta^n}{\alpha - \beta} - \frac{\beta^n}{\alpha - \beta} \left( \frac{a^{1-\xi(n-2)}}{(ab)^{\frac{n-2-\xi(n-2)}{2}}} - \frac{a^{1-\xi(n-2)}}{(ab)^{\frac{n-\xi(n-2)}{2}}} \right)
\]
Since \( \xi(n) = \xi(n-2) \) and \( \alpha + \beta = ab \), we get
\[
q_n - \frac{\beta^2}{ab} q_{n-2} = \frac{a^{1-\xi(n)}}{(ab)^{n-\xi(n)/2}} \alpha^{n-2}.
\]
Multiplying Eq.(17) by \( \frac{\alpha^2}{ab} = \alpha + 1 \) and using \( \alpha \beta = -ab \), we have
\[
q_n \alpha + (q_n - q_{n-2}) = \frac{a^{1-\xi(n)}}{(ab)^{n-\xi(n)/2}} \alpha^n.
\]
From the definitions Eq.(6) and Eq.(14), we have
\[
q_n - q_{n-2} = a^{-1-\xi(n)} b^{\xi(n)} q_{n-1}.
\]
Thus we have
\[
q_n \alpha + a^{-1-\xi(n)} b^{\xi(n)} q_{n-1} = \frac{a^{1-\xi(n)}}{(ab)^{n-\xi(n)/2}} \alpha^n.
\]
Also, if we change \( \alpha \) and \( \beta \) role above process, we obtain the desired result Eq.(16).

**Remark.** For some positive integer \( k \), if \( a = b = k \), then \( \{q_n\} \) is the \( k \)-Fibonacci sequence \( \{f_{k,n}\} \) (for more details see [1]). In this case, let \( Q = \begin{pmatrix} k & 1 \\ 1 & 0 \end{pmatrix} \) be a companion matrix of \( \{f_{k,n}\} \) and
\[
\phi = \frac{1}{2}(k + \sqrt{k^2 + 4}), \quad \varphi = \frac{1}{2}(k - \sqrt{k^2 + 4})
\]
be the roots of the quadratic equation \( x^2 - kx - 1 = 0 \) provided \( k^2 + 4 \neq 0 \). Then
\[
\alpha = \frac{1}{2} (k^2 + \sqrt{k^4 + 4k^2}) = k \phi, \quad \beta = \frac{1}{2} (k^2 - \sqrt{k^4 + 4k^2}) = k \varphi,
\]
\[
a^{-1} a^{\frac{n+\xi(n)}{2}} b^{\frac{n-\xi(n)}{2}} = k^{n-1}, \quad a^{-\frac{n-\xi(n)}{2}} b^{\frac{n+\xi(n)}{2}} = k^n.
\]
Thus we have
\[
Eq.(16) \iff \begin{cases} (k \phi)^n = k^{n-1} f_{k,n} \phi + k^n f_{k,n-1}, \\ (k \varphi)^n = k^{n-1} f_{k,n} \varphi + k^n f_{k,n-1}, \\ \phi^n = f_{k,n} \phi + f_{k,n-1}, \\ \varphi^n = f_{k,n} \varphi + f_{k,n-1}. \end{cases}
\]
and if we change \( \phi, \varphi \) into the matrix \( Q \) and change \( f_{k,n-1} \) into the matrix \( f_{k,n-1} I \), then the matrix form of the \( n \)th power \( Q^n \) is given by
\[
Q^n = f_{k,n} Q + f_{k,n-1} I = \begin{pmatrix} f_{k,n+1} & f_{k,n} \\ f_{k,n} & f_{k,n-1} \end{pmatrix} \quad \text{(see [6], page 2)}
\]
and we obtain the Cassini’s identity for \( \{f_{k,n}\} \)
\[
f_{k,n-1}f_{k,n+1} - f_{k,n}^2 = (-1)^n \text{ (see [1], Proposition 3)}.
\]

**Lemma 3.2.** Let \( M = \begin{pmatrix} ab & b \\ a & 0 \end{pmatrix} \) be a companion matrix of the generalized Fibonacci sequence \( \{q_n\} \) defined by Eq.(6). Then we have for all integer \( n \geq 1 \),
\[
M^{2n-1} \begin{pmatrix} q_1 \\ q_0 \end{pmatrix} = (ab)^{n-1} \begin{pmatrix} bq_{2n} \\ aq_{2n-1} \end{pmatrix} \tag{18}
\]
and
\[
M^{2n} \begin{pmatrix} q_1 \\ q_0 \end{pmatrix} = (ab)^n \begin{pmatrix} q_{2n+1} \\ q_{2n} \end{pmatrix} \tag{19}
\]

**Proof.** We will use the induction method on \( n \). If \( n = 1 \), then
\[
\text{LHS of Eq.}(18) = M \begin{pmatrix} q_1 \\ q_0 \end{pmatrix} = \begin{pmatrix} ab & b \\ a & 0 \end{pmatrix} \begin{pmatrix} q_1 \\ q_0 \end{pmatrix} = \begin{pmatrix} b(q_1 + q_0) \\ aq_1 \end{pmatrix} = \begin{pmatrix} bq_2 \\ aq_1 \end{pmatrix} = \text{RHS of Eq.}(18).
\]
We suppose that Eq.(18) holds for \( n = 2, 3, \cdots, m \), i.e.,
\[
M^{2m-1} \begin{pmatrix} q_1 \\ q_0 \end{pmatrix} = (ab)^{m-1} \begin{pmatrix} bq_{2m} \\ aq_{2m-1} \end{pmatrix}.
\]
Now, we show that Eq.(18) holds for \( n = m + 1 \). By assumption, we have
\[
M^{2m+1} \begin{pmatrix} q_1 \\ q_0 \end{pmatrix} = M^2 \left\{ M^{2m-1} \begin{pmatrix} q_1 \\ q_0 \end{pmatrix} \right\} = (ab)^{m-1} M^2 \begin{pmatrix} bq_{2m} \\ aq_{2m-1} \end{pmatrix}
\]
\[
= (ab)^{m-1} \begin{pmatrix} ab & b \\ a & 0 \end{pmatrix} \begin{pmatrix} ab & b \\ a & 0 \end{pmatrix} \begin{pmatrix} bq_{2m} \\ aq_{2m-1} \end{pmatrix}
\]
\[
= (ab)^m \begin{pmatrix} ab & b \\ a & 0 \end{pmatrix} \begin{pmatrix} a^2q_{2m} + abq_{2m-1} \\ abq_{2m} \end{pmatrix}
\]
\[
= (ab)^m \begin{pmatrix} ab & b \\ a & 0 \end{pmatrix} \begin{pmatrix} q_{2m+1} \\ q_{2m} \end{pmatrix}
\]
\[
= (ab)^m \begin{pmatrix} b(aq_{2m+1} + q_{2m}) \\ aq_{2m+1} \end{pmatrix}.
\]
Linearization of generalized Fibonacci sequences

\[ (ab)^m \left( \frac{bq_{2m+2}}{aq_{2m+1}} \right). \]

Next, using Eq.(18) we obtain Eq.(19) as follows:

\[
M^{2n} \begin{pmatrix} q_1 \\ q_0 \end{pmatrix} = M \left\{ M^{2n-1} \begin{pmatrix} q_1 \\ q_0 \end{pmatrix} \right\} = M \left\{ (ab)^{n-1} \begin{pmatrix} bq_{2n} \\ aq_{2n-1} \end{pmatrix} \right\} \\
= (ab)^{n-1} \begin{pmatrix} ab & b \\ a & 0 \end{pmatrix} \begin{pmatrix} bq_{2n} \\ aq_{2n-1} \end{pmatrix} \\
= (ab)^{n-1} \begin{pmatrix} ab^2q_{2n} + abq_{2n-1} \\ abq_{2n} \end{pmatrix} \\
= (ab)^n \begin{pmatrix} bq_{2n} + q_{2n-1} \\ q_{2n} \end{pmatrix} \\
= (ab)^n \begin{pmatrix} q_{2n+1} \\ q_{2n} \end{pmatrix}.
\]

Theorem 3.3. Let \( M = \begin{pmatrix} ab & b \\ a & 0 \end{pmatrix} \) be a companion matrix of the generalized Fibonacci sequence \( \{q_n\} \) defined by Eq.(6). For all integer \( n \geq 1 \), the matrix form of the \( n \)th power \( M^n \) is given by

\[
\begin{align*}
M^{2n-1} &= (ab)^{n-1} \begin{pmatrix} bq_{2n} \\ aq_{2n-1} \end{pmatrix} \begin{pmatrix} bq_{2n-2} \\ bq_{2n-2} \end{pmatrix}, \\
M^{2n} &= (ab)^{n-1}b \begin{pmatrix} aq_{2n+1} \\ aq_{2n} \end{pmatrix} \begin{pmatrix} bq_{2n} \\ aq_{2n-1} \end{pmatrix}.
\end{align*}
\]

Proof. From Eq.(16) we have

\[
\begin{align*}
\alpha^{2n-1} &= (ab)^{n-1}(q_{2n-1} \alpha + bq_{2n-2}), \\
\beta^{2n-1} &= (ab)^{n-1}(q_{2n-1} \beta + bq_{2n-2}), \\
\text{and} \quad \alpha^{2n} &= (ab)^{n-1}b(q_{2n} \alpha + aq_{2n-1}), \\
\beta^{2n} &= (ab)^{n-1}b(q_{2n} \beta + aq_{2n-1}).
\end{align*}
\]

In Eq.(21), if we change \( \alpha, \beta \) into the matrix \( M \) and change \( bq_{2n-2} \), \( aq_{2n-1} \) into the matrix \( bq_{2n-2}I \), \( aq_{2n-1}I \), then we have

\[
\begin{align*}
M^{2n-1} &= (ab)^{n-1}(q_{2n-1}M + bq_{2n-2}I), \\
M^{2n} &= (ab)^{n-1}b(q_{2n}M + aq_{2n-1}I).
\end{align*}
\]
In fact, Eq.(22) holds for the following reason: using Eq.(18) and Eq.(19) in Lemma 3.2,

\[ M^{2n-1} \left( \begin{array} { l } { q_1 } \\ { q_0 } \end{array} \right) = (ab)^{n-1} \left( \begin{array} { l } { bq_{2n} } \\ { aq_{2n-1} } \end{array} \right) \]

and

\[ (ab)^{n-1} (q_{2n-1} M + bq_{2n-2} I) \left( \begin{array} { l } { q_1 } \\ { q_0 } \end{array} \right) \]

\[ = (ab)^{n-1} \left( \begin{array} { c c } { abq_{2n-1} + bq_{2n-2} } & { bq_{2n-1} } \\ { aq_{2n-1} } & { bq_{2n-2} } \end{array} \right) \left( \begin{array} { l } { q_1 } \\ { q_0 } \end{array} \right) \]

\[ = (ab)^{n-1} \left( \begin{array} { c c } { abq_{2n-1} + bq_{2n-2} } \\ { aq_{2n-1} } \end{array} \right) \]

\[ = (ab)^{n-1} \left( b(aq_{2n-1} + q_{2n-2}) \right) \left( \begin{array} { l } { q_1 } \\ { q_0 } \end{array} \right) \]

\[ = (ab)^{n-1} \left( \begin{array} { l } { bq_{2n} } \\ { aq_{2n-1} } \end{array} \right). \]

Similarly,

\[ M^{2n} \left( \begin{array} { l } { q_1 } \\ { q_0 } \end{array} \right) = (ab)^n \left( \begin{array} { l } { q_{2n+1} } \\ { q_{2n} } \end{array} \right) \]

and

\[ (ab)^{n-1} b(q_{2n} M + aq_{2n-1} I) \left( \begin{array} { l } { q_1 } \\ { q_0 } \end{array} \right) \]

\[ = (ab)^{n-1} b \left( \begin{array} { c c } { abq_{2n} + aq_{2n-1} } & { bq_{2n} } \\ { aq_{2n} } & { aq_{2n-1} } \end{array} \right) \left( \begin{array} { l } { q_1 } \\ { q_0 } \end{array} \right) \]

\[ = (ab)^{n-1} b \left( \begin{array} { c c } { abq_{2n} + aq_{2n-2} } \\ { aq_{2n} } \end{array} \right) \]

\[ = (ab)^{n-1} b \left( a(bq_{2n} + q_{2n-1}) \right) \left( \begin{array} { l } { q_1 } \\ { q_0 } \end{array} \right) \]

\[ = (ab)^{n-1} b \left( \begin{array} { l } { aq_{2n+1} } \\ { aq_{2n} } \end{array} \right) \]

\[ = (ab)^n \left( \begin{array} { l } { q_{2n+1} } \\ { q_{2n} } \end{array} \right). \]
Thus from Eq. (22) we obtain the desired result Eq. (20) as follows:

\[
M^{2n-1} = (ab)^{n-1}(q_{2n-1}M + bq_{2n-2}I) \\
= (ab)^{n-1}\left(q_{2n-1}\begin{pmatrix} ab & b \\ a & 0 \end{pmatrix} + bq_{2n-2}\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}\right) \\
= (ab)^{n-1}\left(b(aq_{2n-1} + q_{2n-2}) \begin{pmatrix} bq_{2n-1} \\ aq_{2n-2} \end{pmatrix} \\ bq_{2n-2} \end{pmatrix}\right) \\
= (ab)^{n-1}\begin{pmatrix} bq_{2n} & bq_{2n-1} \\ aq_{2n-1} & bq_{2n-2} \end{pmatrix}
\]

and

\[
M^{2n} = (ab)^{n-1}b(q_{2n}M + aq_{2n-1}I) \\
= (ab)^{n-1}b\left(q_{2n}\begin{pmatrix} ab & b \\ a & 0 \end{pmatrix} + aq_{2n-1}\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}\right) \\
= (ab)^{n-1}b\left(a(bq_{2n} + q_{2n-1}) \begin{pmatrix} bq_{2n} \\ aq_{2n} \end{pmatrix} \\ aq_{2n-1} \end{pmatrix}\right) \\
= (ab)^{n-1}b\begin{pmatrix} aq_{2n+1} & bq_{2n} \\ aq_{2n} & aq_{2n-1} \end{pmatrix}.
\]

\[\square\]

**Remark.** By taking determinant both sides of the matrix form Eq. (20) in Theorem 3.3, we have

\[
\left|\begin{pmatrix} ab & b \\ a & 0 \end{pmatrix}\right|^{2n-1} = \left|\begin{pmatrix} bq_{2n} & bq_{2n-1} \\ aq_{2n-1} & bq_{2n-2} \end{pmatrix}\right| \iff -a = bq_{2n-2}q_{2n} - aq_{2n-1}^2
\]

and

\[
\left|\begin{pmatrix} ab & b \\ a & 0 \end{pmatrix}\right|^{2n} = \left|\begin{pmatrix} aq_{2n+1} & bq_{2n} \\ aq_{2n} & aq_{2n-1} \end{pmatrix}\right| \iff a = aq_{2n-1}q_{2n+1} - bq_{2n}^2.
\]

that is, using the parity function \(\xi(n)\) defined by Eq. (14), we obtain the Cassini’s identity Eq. (15) for \(\{q_n\}\)

\[
a^{1-\xi(n)}b^{\xi(n)}q_{n-1}q_{n+1} - a^{\xi(n)}b^{1-\xi(n)}q_n^2 = a(-1)^n.
\]
